PROPER DISPOSAL OF WASTEWATER

Don't Drain Pools, Spas and Fountains to Storm Drains

When pools are drained into streets, the water flows into storm drains and then straight to local creeks and the San Francisco Bay. It does not go to a wastewater treatment plant first. Water from pools, spas and fountains contain chemicals harmful to fish and aquatic plants living and growing in our watersheds, creeks and Bay. Help contribute to preserving a healthy watershed by using these recommended practices to maintain your pools, spas and fountains

Drain Properly

- Drain pool, spa or fountain water to a sanitary sewer cleanout.
- Don't drain water into a street, gutter or storm drain.
- Draining water that contains copper algaecide or residual chlorine to a storm drain is prohibited.
- Contact your local stormwater agency for assistance with locating the sanitary sewer.

General Maintenance

- Keep your pool, spa or fountain well-maintained with a balanced pH to reduce the need for chemicals or drainage.
- Avoid using copper based algaecides. Ask your pool maintenance service or store for help resolving persistent algae problems without using copper algaecides.
- Select pool products with reduced phosphate. Without phosphate, algae cannot thrive.

Cleaning

- Never clean filters in the street, gutter or storm drain.
- If you need to clean your pool filters, rinse over landscaped areas.
- Fresh water will dilute the chlorine so it won't harm plants or grass.
- Clean sand and diatomaceous earth filters onto a dirt area.
- Keep backwash out of the street and storm drain.
- Dispose of spent filter materials in the trash.

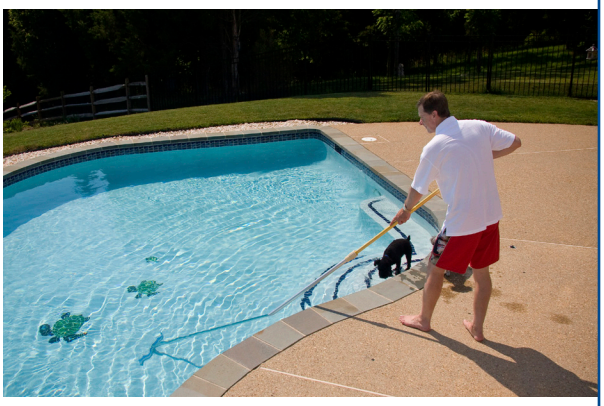
cleanwater PROGRAM

Protecting Alameda County Creeks, Wetlands & the Bay

cleanwaterprogram.org

Keep pool, spa and fountain water out of gutters, streets and storm drains.

Only Rain to the Storm Drain.



Reduce draining by maintaining your pool.

Draining pools, spas, and fountains to storm drains can pollute our creeks and the Bay. Discharge should be directed to sanitary sewer drains.

Did You Know...?

- Chlorine is an effective sterilizer that kills bacteria in pool water. Chlorinated water similarly kills sensitive fish and animals essential to healthy creeks and watersheds.
- Even small amounts of chlorine are harmful to fish. Dozens of fish were killed after a drinking water pipe burst sending thousands of gallons of chlorinated water into a San Francisco Bay area creek in 2013.
- Copper is used to destroy algae in pools, spas and fountains. When copper-treated water enters our creeks and waterways it has a similar effect on the plants and organisms in these environments. Copper additives are highly toxic to most aquatic species even in small amounts.
- Most wastewater treatment plants can remove some, but not all copper. It is essential to reduce or eliminate the use of copper in pools, spas and fountains to protect our waterways.
- Phosphate is an effective plant nutrient that promotes algae growth in creeks. Algae blooms in creeks reduce the amount of oxygen in the water and cause warming of creeks to levels that damage fish and plant life dependent upon a clean water to survive.

KEY DEFINITIONS

A ***Cleanout*** is a pipe fitting with a removable plug for inspecting and cleaning out sewer drain pipes.

The ***Storm Drain System*** was built to collect and transport rain to prevent flooding in urban areas. Anything that flows or is discharged into the storm drain system goes directly into local creeks or San Francisco Bay without any treatment.

The ***Sanitary Sewer System*** collects and transports sanitary wastes from interior building plumbing systems to the wastewater treatment plant where the wastewater is treated.
